

ondia

The logo for 'ondia' is centered on a white background. The word is written in a lowercase, rounded sans-serif font. The letters 'o', 'n', and 'd' are a medium purple, while 'i' and 'a' are a darker blue. A light blue and teal graphic element is positioned behind the 'd'. The background features four purple triangular accents in the corners, pointing towards the center.

# What is OSI Reference Model?

# What is OSI Reference Model?

The **OSI** provides a standard for different computer systems to be able to communicate with each other

Developed by ISO in 1984

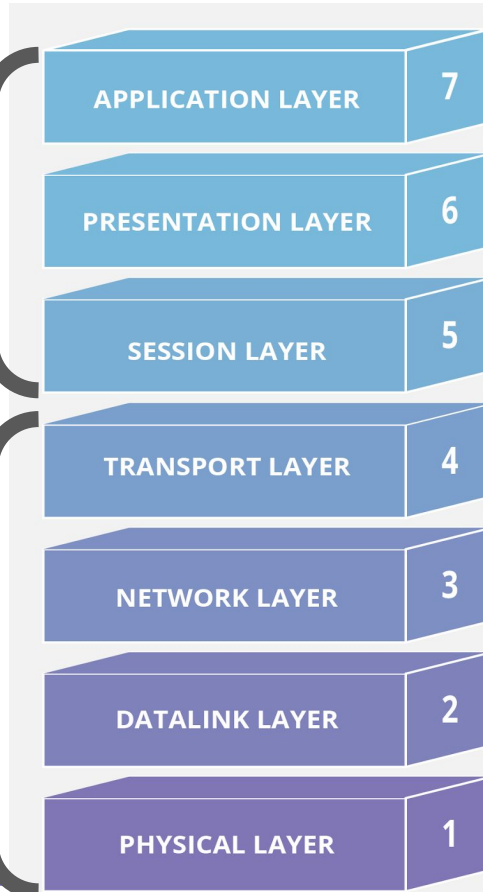

# What is OSI Reference Model?

**Lower Layers**  
**(Network)**

**Upper Layers**  
**(OS)**

- Human-computer interaction layer, where applications can access the network services
- Ensures that data is in a usable format and is where data encryption occurs
- Maintains connections and is responsible for controlling ports and sessions
- Transmits data using transmission protocols including TCP and UDP
- Decides which physical path the data will take
- Defines the format of the data on the network
- Transmits raw bit stream over the physical medium

2

# Layers of the OSI Model

# Application Layer (Layer 7)

- Directly interacts with data from the user
- Software applications (web browsers, email clients, etc.) rely on the application layer to initiate communications

# ► Presentation Layer (Layer 6)

- Primarily responsible for preparing data
- Translates, encrypts, and compresses data

# Session Layer (Layer 5)

- Responsible for opening and closing communication between the two devices
- The time between when the communication is opened and closed is known as the session
- Synchronizes data transfer

Session of communication

# ► Transport Layer (Layer 4)

- Responsible for end-to-end communication between the two devices
- Takes data (from upper layer) and breaks into segments
- Responsible for flow control and error control

# ► Network Layer (Layer 3)

- Facilitates data transfer between two different networks
- Takes data segments (from upper layer) and breaks into packets

# ▶ Data Link Layer (Layer 2)

- Facilitates data transfer between two devices on the same network
- Takes data packets (from upper layer) and breaks into frames
- Responsible for flow control and error control

Frame Creation

Transport

Transfer frames between  
network nodes

# ► Physical Layer (Layer 1)

- Includes physical equipment

cables

repeaters

modems

transceivers

media converters

hubs

etc.

- Data is converted into bit streams

3

# Data Encapsulation

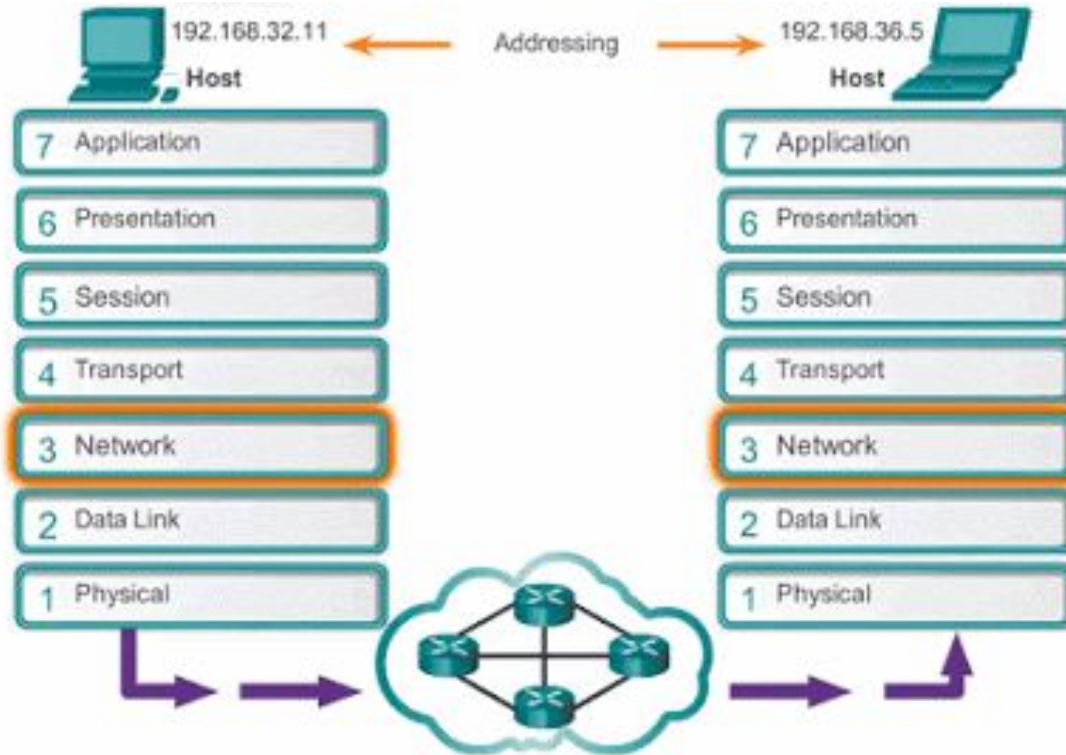

# ▶ Data Encapsulation

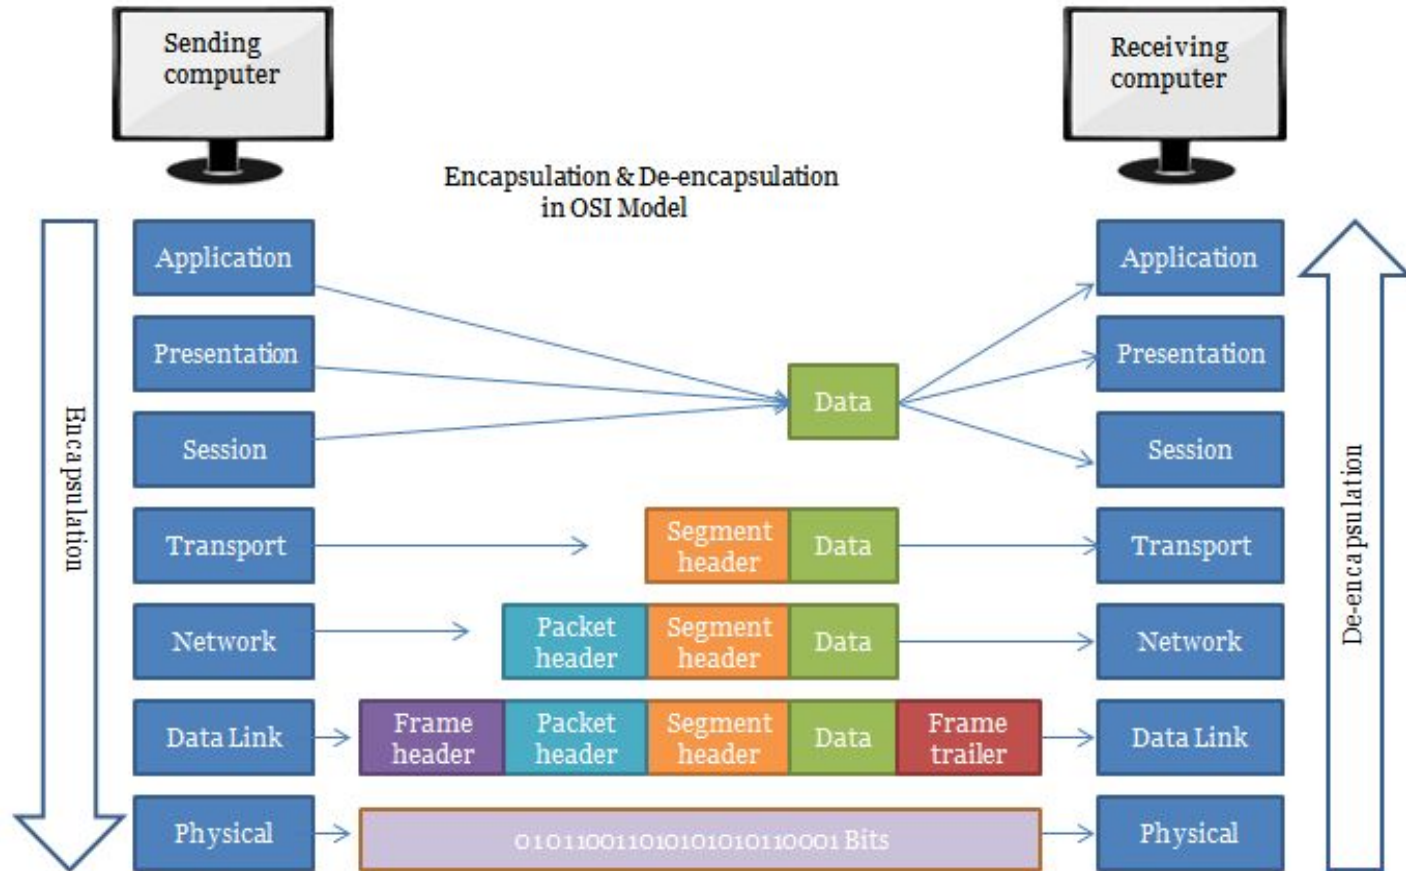

- For two nodes communicate they must use the same protocol
- Each layer (*OSI or DoD*) communicates with its equivalent layer on the other node via the lower layers of the model
- Each layer provides services for the layer above and uses the services of the layer below
